For Immediate Release:

**VersaReports Announces Progressive Logistics Services Has Deployed Universal Report Server To Help Clients Better Manage Their Business**

***Reports Benchmark Performance of Shippers***

**May 25, 2010 - Atlanta, GA.** – [VersaReports](#), creator of reporting software products that help businesses achieve their [reporting](#) goals without breaking their budget, announces that Progressive Logistics Services (PLS) has chosen VersaReports Universal Report Server (URS) to provide reports for customers that allow them to better manage their business and benchmark their performance. PLS is an Atlanta, Ga. based provider of managed freight handling personnel to grocery, food service, tire and retail distribution warehouse centers across the country.

"Previously, we used Crystal Reports Server to distribute a number of reports throughout our organization and to customers," said Christopher Capps, Assistant Vice President of IT and Procurement at PLS. "We felt very limited by their scheduling and distribution capabilities and the web based per-user fees were not cost effective for our environment."

"Universal Report Server provides an enterprise-class report server with [per-server pricing](#) for less cost and is more flexible than any report server on the market today," said Andy Feibus, CEO of VersaReports. "Users can store completed reports in the database for security or on disk for faster access and easier backup."

[Universal Report Server](#) works with any report designer that supports Microsoft.Net and offers similar, yet better, scheduling, security, archival, and distribution functionality. Other features include a multi-threaded report runner, so that more than one report can be scheduled to run at any moment and time zone "normalization," so that timestamps are displayed using the time zone in the user's location. In addition, VersaReports URS pages easily integrate into an existing corporate portal and can be configured to match any corporate portal look.

As a leader in customer service for their distribution center clients, PLS wanted to offer customized reporting with Key Performance Indicators for any captured performance metric. Universal Report Server (URS) allows them to do deliver those results. Customers can choose from a variety of reports that can track product from when it enters the facilities gate until it is securely in their warehouse. Other customized reports are available that can provide production benchmarking, and more. Customers gain access to better information for quicker decision-making.

**About VersaReports**

[VersaReports](#), LLC, an Atlanta, GA company, delivers enterprise reporting solutions for developers to analysts to executives that provide better analysis and planning that can be a catalyst for improving the bottom line. Universal Report Server provides scheduling, distribution, and archival of reports created with nearly any Microsoft.NET-based report designer package. It is the only product on the market today that offers multi-server reporting functionality. Universal Report Server is the ideal solution for empowering users to better understand their current business situation, allowing for quicker decision making and superior communications.
