

VersaReports Announces Release of Universal Report Server

Dunwoody, GA (December 15, 2009) - VersaReports announces the release of their flagship Universal Report Server product.

Universal Report Server (URS) for the Microsoft® .NET platform is the first report server that hosts reports created with any .NET-based reporting packages, including SAP® Crystal Reports®, DevExpress™ XtraReports™, GrapeCity/Data Dynamics ActiveReports for .NET, and Telerik Reporting.

With Universal Report Server, you can:

- Work with any reporting package you want
- Schedule reports to run at any frequency you need
- Pass parameters to reports
- Easily integrate with your existing security infrastructure and corporate portal design
- Store reports in any format, including the native format of the report designer package
- Maintain old runs of your reports for as long as you want.

No longer will you be required to purchase or build a web reporting server for your report designer of choice. No longer will you be forced to use a terrible report designer because it's the only one that has an enterprise-ready report server. Universal Report Server provides a great solution with an affordable *per-server* price starting at \$4995.

"We have a number of reports based on Crystal Reports, but were never satisfied using the Crystal Reports Server to distribute those reports throughout our organization or to our customers," said Christopher Capps, Senior Director of IT and Procurement at Progressive Logistics Services, an Atlanta, Ga. based outsource provider of managed labor to warehouses, distribution centers and manufacturing plants. "We've been working with Universal Report Server for 6 months now, and it offers everything we need from a report server at a better price. Over the next year, we plan to use URS to expand the use of reporting throughout our organization as part of our productivity and client retention initiatives."

"Over the years, I've spoken with numerous CIOs who wanted to deploy report servers in their organization, but didn't like the limited choices available and the costs involved," said Andy Feibus, founder of VersaReports. "We created Universal Report Server to provide an enterprise-class report server that costs a lot less than implementing one from scratch and is more flexible than any report server on the market today."

Universal Report Server is available for immediate purchase at www.versareports.com or through our reseller, ComponentSource, at www.componentsource.com. A no-obligation fully functional 30-day trial is also available for download from versareports.com. For users who want to try the software without installing it on their own server, a copy of the software has been installed and configured for public use at www.versareports.com/demo.
